

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	29 September 2026
Team ID	SWTID-2026-4375
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	UI Policy Configuration	Create UI Policy "High Impact Control" on the Incident table (condition: Impact is 1 - High) UI Policy Action: make Assignment group mandatory Set "Reverse if false" so field changes revert when Impact is no longer High
FR-2	Field Control - Urgency	UI Policy Action: make Urgency read-only when Impact = High onChange Client Script on Impact: auto-set Urgency to 1 - High Show an info message: "Urgency set to High for High impact incident."
FR-3	Save-time Validation (onSubmit)	Block Incident save when Impact = High and Assigned To is empty Show an error box on the Assigned To field: "Assigned To is mandatory for High impact incidents."
FR-4	List Edit Restriction (onCellEdit)	Block direct editing of the State field from the Incident list view Show an alert asking the user to open the Incident form; State value stays unchanged Allow State changes made through the Incident form
FR-5	Testing & Verification	Test mandatory enforcement (save blocked without Assigned To) Test successful save (Assigned To filled) Test reverse condition (Impact High to Medium) Test list-edit blocking and form-based State update
FR-6	Administration & Access	Only users with administrative / configuration access

		can create UI Policies and Client Scripts (System UI) Policies and scripts are stored as platform records and can be activated or deactivated
--	--	---

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Clear, immediate on-form feedback: mandatory markers, read-only Urgency, an info message and a red error box next to the Assigned To field. The guidance uses plain language and works without a page reload.
NFR-2	Security	Client Scripts run in isolated mode. Only administrators can create or change UI Policies and Client Scripts (role-based ACLs). Access to the instance is over HTTPS.
NFR-3	Reliability	Validation runs the same way on every Incident form and list load. Reverse if false restores fields automatically, so a user cannot be left with a stuck mandatory or read-only field. Invalid records are never saved.
NFR-4	Performance	Rules run in the browser, so responses are instant with no extra server round-trip for validation. Scripts are short (a few lines each) and do not slow down form load.
NFR-5	Availability	Runs on the ServiceNow-hosted cloud instance with redundant infrastructure managed by ServiceNow. There are no extra external services to depend on.
NFR-6	Scalability	The same policy and scripts apply to every Incident record and every user on the instance. Client-side validation reduces server load as Incident volume grows, and rules can be extended to other fields and tables.
