

Scalability & Future Plan

Date	1 October 2026
Team ID	SWTID-2026-4375
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	1 Mark

Scalability & Future Plan:

This document lists the limitations of the current Incident client-side controls and explains how they can be scaled and extended, for example with server-side controls, role-based exceptions and use on other tables, along with the planned phases.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address (High / Medium / Low)
1	The controls are client-side only. Records created by imports or integrations are not checked by them.	Incomplete or incorrect records can still enter through other routes	High
2	Urgency is set to High when Impact becomes High but is not changed back when Impact is lowered.	Impact and Urgency can become inconsistent	Medium
3	The onCellEdit script blocks every list edit of State, with no exception for any role.	Authorised users cannot update State quickly from the list	Medium
4	Load with many users and response times have not been measured.	Behaviour under heavy use is unknown	Medium
5	Assigned to is enforced only on Submit, and values and message texts are written inside the scripts.	Users find out late, and any change needs the scripts to be edited	Low

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Tested with a small number of test incidents and no formal load test	Test with many users creating and editing Incidents at the same time and check how the form responds
2	Data Storage	Uses the built-in Incident table; no extra tables were added	Keep using the same table and archive old closed incidents as records grow
3	Performance	Each script is a few lines and runs in the browser; no timings were measured	Measure form load and save times as more rules are added and keep the scripts short
4	Security	Configured with administrative access; the rules apply to every user of the form	Give each role only the access it needs, add role-based exceptions and add server-side controls
5	Extensibility	Works for Impact 1 - High on the Incident table	Reuse the same pattern for other impact levels, fields and tables

Future Roadmap:

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 2	Reset Urgency when Impact is lowered; show Assigned to as mandatory on the form for High impact	Next iteration	Fields stay aligned and users see the requirement before they submit
Phase 3	Role-based exceptions in the onCellEdit script; move message texts and values to configurable messages or properties	After Phase 2	Authorised users work faster and the rules are easier to maintain
Phase 4	Server-side controls for imports and integrations; extend the rules to other fields and tables	Later	The same data standards apply on every route into the Incident table
